

## STORM WATER MANAGEMENT

The federal Clean Water Act requires National Pollution Discharge Elimination System (NPDES) permits for storm water discharges from municipal separate storm sewer systems (MS4), and storm water discharges from industrial and construction activities. These permits focus on preventing the runoff of contaminated storm water from a site. Generally this runoff is untreated and goes directly into local water bodies. Each of these permits has a number of requirements that need to be implemented for the site's regulatory compliance. These requirements generally include development and implementation of a site plan and site specific Best Management Practices (BMPs).

Tenera staff has assisted a number of clients over the past 10 years in their compliance with the evolving storm water regulations. In some instances cost sharing was used to develop a single document that covered the majority of the requirements at multiple locations and then small adjustments were made to cover the specifics at each location.

### SERVICES INCLUDE:

- Completion of Notice of Intent (NOI) paperwork
- Develop Storm Water Management Plans (SWMP), Guidance Documents, and Implementation Plans
- Develop and conduct required annual and new employee training
- Develop online storm water training module
- Develop and implement Storm Water Pollution Prevention Plans (SWPPP)
- Completion of Annual Reports
- Represent clients at meetings with regulators
- Develop /update Corporation Yard Plan for municipality's implementation for compliance
- Update Municipal Operations Plan to incorporate all city activities related to storm water
